SUMMARY

I work at a Canberra cafe, and I also built the system it trades on. Muster POS takes card payments at the counter and online, prints the kitchen's dockets, handles bookings and a loyalty card, and keeps selling when the internet drops out. I wrote it, deployed it on the shop's own computer, and I am the one who keeps it running. Working the floor is why it is any good: I built the till I have to use. Looking for a full-stack or payments role.

EXPERIENCE

Ichi Cafe · waiter, and the cafe's developer

2023 – present · Kippax, ACT

Muster POS, the point-of-sale system the cafe trades on every day. I am its only developer. musterpos.com · github.com/phuanh20001/Muster-POS

- I have worked the counter here since 2023. In 2026 I built the cafe's till, because from the floor I could see what slowed service down and what went wrong under pressure. Every sale the cafe makes now runs through software I wrote and still look after on my own.
- When something breaks before opening, it is mine to fix, usually remotely and before staff arrive.
- The till accepts card payments through three different providers and behaves the same way whichever one is switched on. Each sale remembers who processed it, so a refund always goes back the way the money came in.
- For the newest of those I connected the till straight to the bank's card reader, writing the low-level messaging myself instead of using a ready-made plugin. It is now going through the bank's certification.
- Money is worked out exactly, never with the small rounding errors ordinary computer maths introduces, and a report flags any sale that disagrees with the payment provider by even one cent.
- Updates test and install themselves, and undo themselves if anything fails, because a bad update at opening time means the shop cannot take money. Backups are proven by restoring them, not just by running.
- Also built alongside the till: ordering online for pickup, a loyalty stamp card, table bookings including repeating weekly ones, staff clock-in, and the owner's daily sales and tax reporting.

Built with: JavaScript, Next.js, PostgreSQL, Prisma, Tailwind, Stripe, Square, Linkly / PC-EFTPOS, Cloudflare Tunnel

OTHER PROJECTS

AntiqChain

github.com/phuanh20001/AntiqueSystem

University capstone project

A marketplace for antiques where each item's ownership history is recorded on a blockchain, so it cannot be quietly rewritten later. Includes logins and printable certificates. Built with Node.js, Express, MongoDB and Solidity.

Identity

github.com/phuanh20001/Identity

Built to practise security engineering

A sign-in system using face recognition, with checks that reject a photo held up to the camera, one-time codes as a second step, and biometric data kept encrypted so the original images are never stored. Python and FastAPI, with an Android app in Kotlin.

CryptoWallet

github.com/phuanh20001/CryptoWallet

Ethereum wallet

Send and receive cryptocurrency and check balances, with a React front end over a Node.js backend.

WETHair

github.com/phuanh20001/WETHair

Android weather app

Search any city, save the ones you check often, and see current conditions plus a five-day forecast as charts. Written in Java for Android.

SKILLS

Languages & data	JavaScript, Java, Python, SQL, PostgreSQL, MongoDB, SQLite
Web	React, Next.js, Node.js, Express, FastAPI, Prisma, Tailwind CSS
Payments	Stripe, Square, Linkly / PC-EFTPOS card terminals
Other	Android (Java/Kotlin), Solidity, Git, Vercel, Cloudflare, Windows server administration

EDUCATION

Bachelor of Information Technology

2023–2026

Crown Institute of Higher Education, Australia

Bachelor of English Pedagogy

2018–2023

Saigon University, Vietnam
